Operator Certification Course Integrity Testing Methodology

Hydrophobic filter Integrity Testing

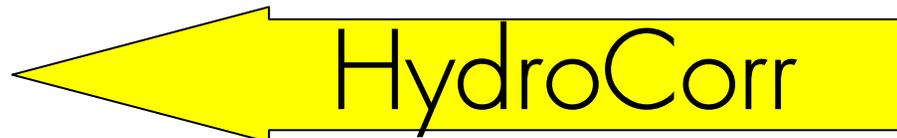

Integrity testing overview

➤ Particle based

- Microorganism
- Aerosols

➤ Liquid property based

- Alcohols
- Water

Particle Based Integrity Testing

Microorganism - Destructive Test

- Aerosol microorganisms or liquid bacterial challenge
- Phage (T1, T3, phiX)
- Bacteria (B. diminuta)

Aerosol Based - Non-destructive Test

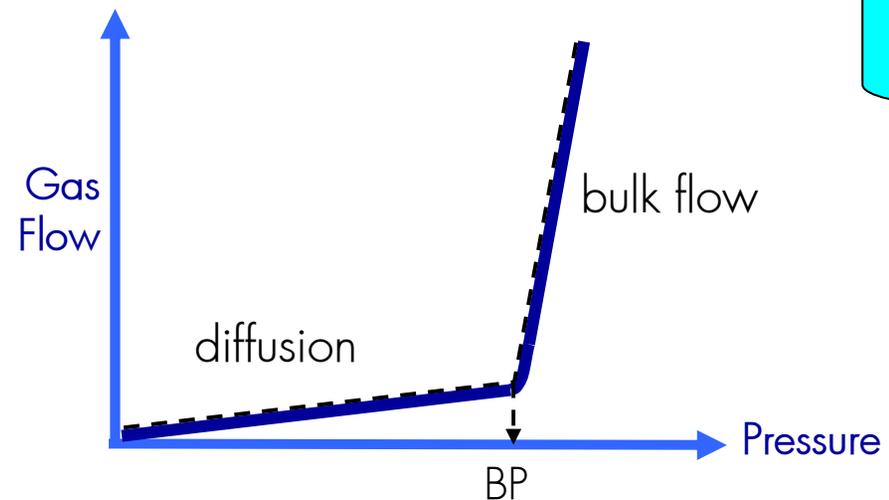

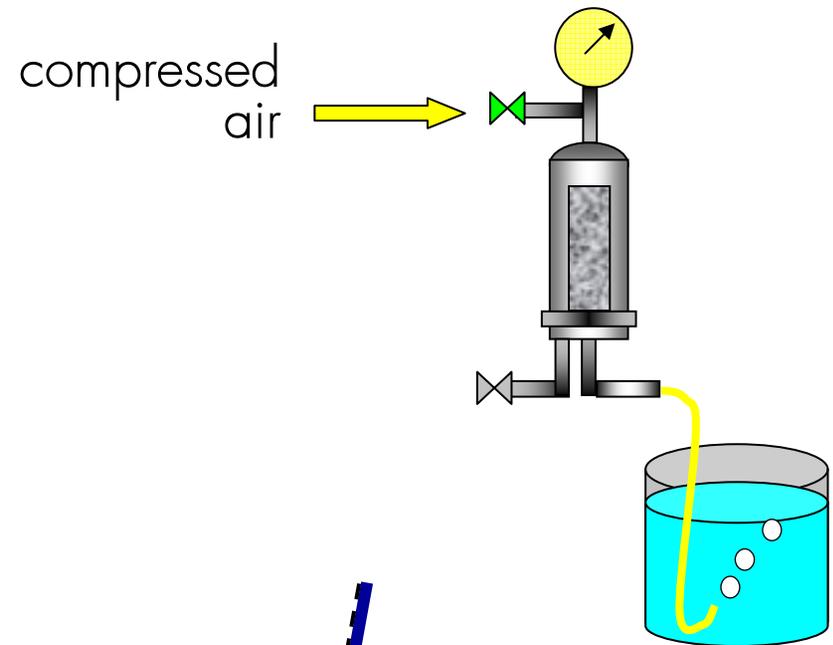

- "Smoke": D.O.P. (Di-Octyl Phthalate), Glycerol, Corn oil (Dispersed Oil Particulate) etc
- Methylene Blue, Sodium Flame
- Issues
 - Particle Distribution must be uniform
 - Must have correlation of particles vs microorganisms
 - High equipment cost
 - Difficult to perform in-situ (particle counter downstream of filter)

Alcohol test

Traditional Testing Principles

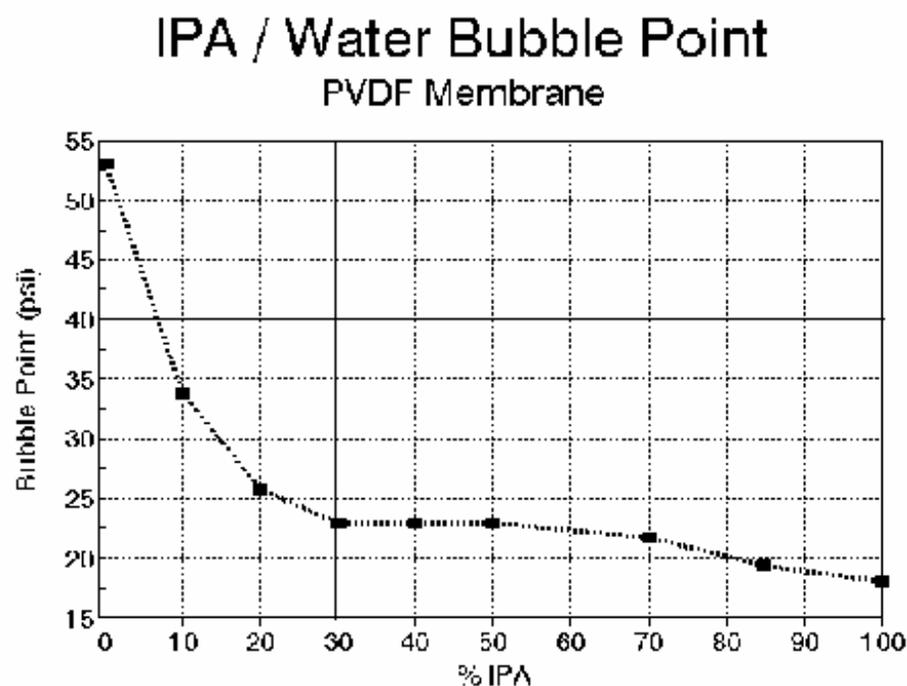

- ▶ Typical wetting liquids are Isopropyl Alcohol (I.P.A. or Propanol-2), Methanol, Tert-butyl Alcohol, or a mixture of one of these and water
- ▶ Uses same principles as a hydrophilic test

Diffusion & Bubble point

Alcohol test

Solvent Effects on Bubble Point

- Changing solvent changes wetting & contact angle
- Check alcohol concentration & quality

Alcohol test

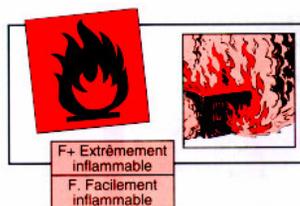

Advantages

- **No special equipment required**
- **Follows similar procedures to hydrophilic membranes. Operator training time is reduced**
- **Traditional**
- **Reduced temperature influence**
- **Widely accepted**
- **Well understood**
- **Correlated to bacterial challenge**
- **Can be performed easily & quickly**

Alcohol test Issues

➤ Alcohol / Water mixtures are often used due to:

- cost
- flammability
- high diffusion
- possibility of evaporation

➤ Secure areas and equipment needed

➤ Can be difficult to perform in-situ

➤ Some concerns with residual test solution remaining in filter holder / pipework after testing

➤ Residual solution should be removed before filter sterilization

Alternatives to Alcohol Integrity Testing

Needed primarily due to:

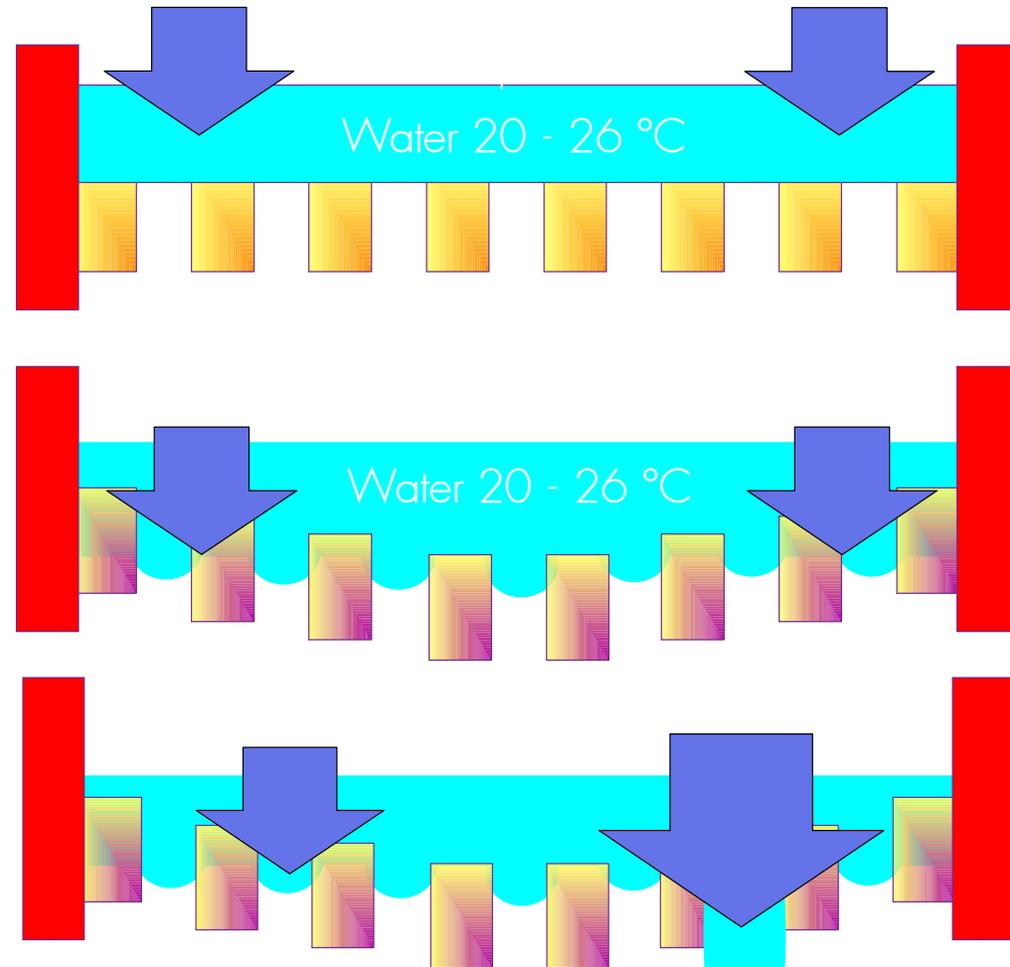

- Issues with alcohol contamination of processes
 - residues
- Risks inherent with the use of solvents

Water-Based Integrity Tests have been developed to overcome these issues

- Ease of use

Advantages of HydroCorr Test

- HydroCorr test only involves water
 - no downstream operation
 - minimal water flow
 - does not compromise sterility
- Easy to automate
- Test can be performed
 - in-line
 - after SIP
 - before and after lyophilization

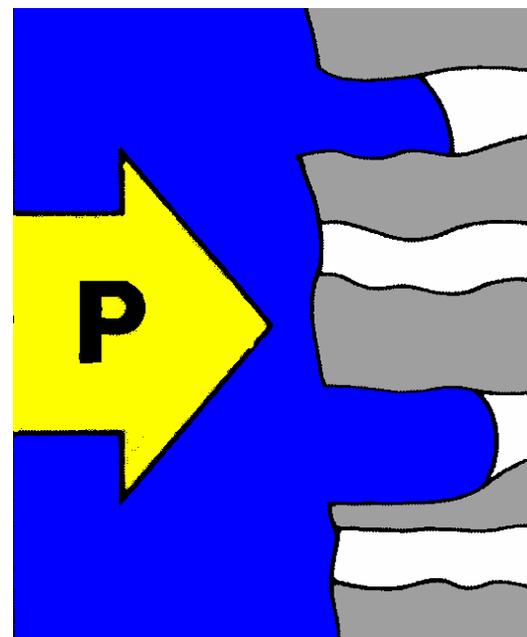

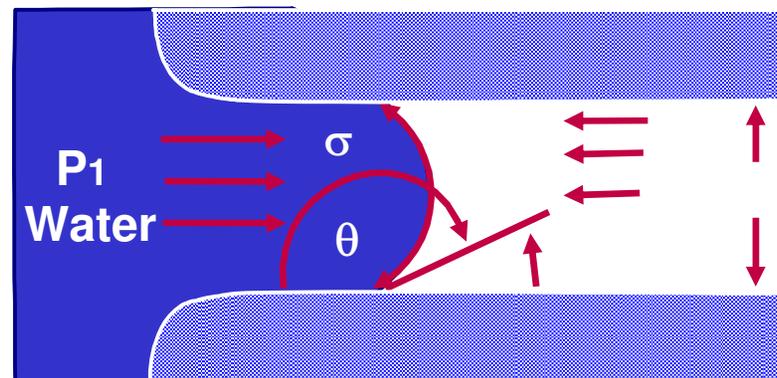

Water test

Water-Based Integrity Test Basis

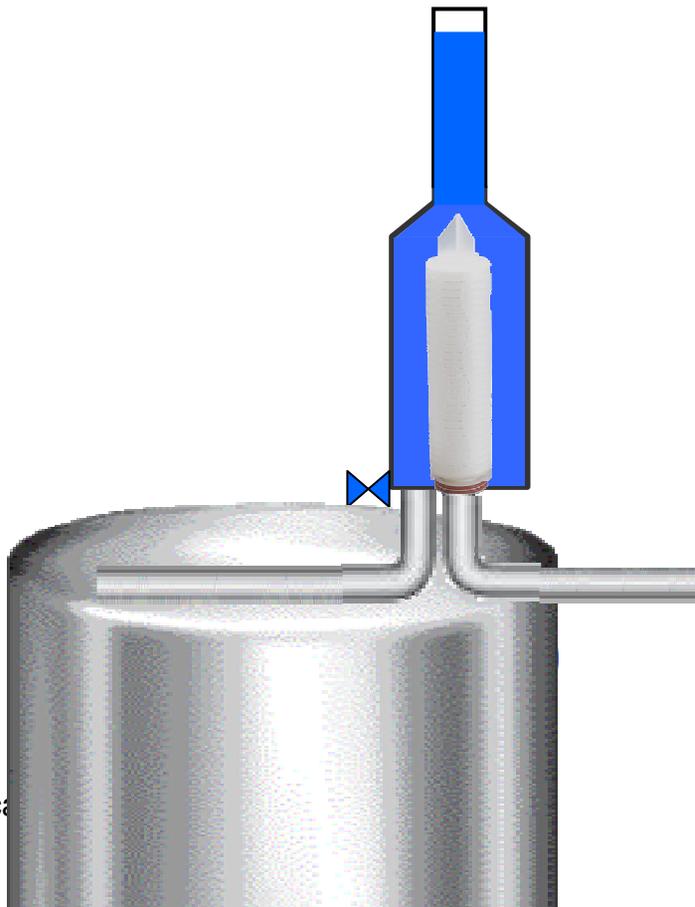

- ▶ Hydrophobic polymers repel water
- ▶ **Water Intrusion Pressure**
The minimum pressure necessary to force water into the largest pores of a **hydrophobic** membrane.

$$IP = - \frac{4k\sigma \text{Cos}(\theta)}{d}$$

Water test

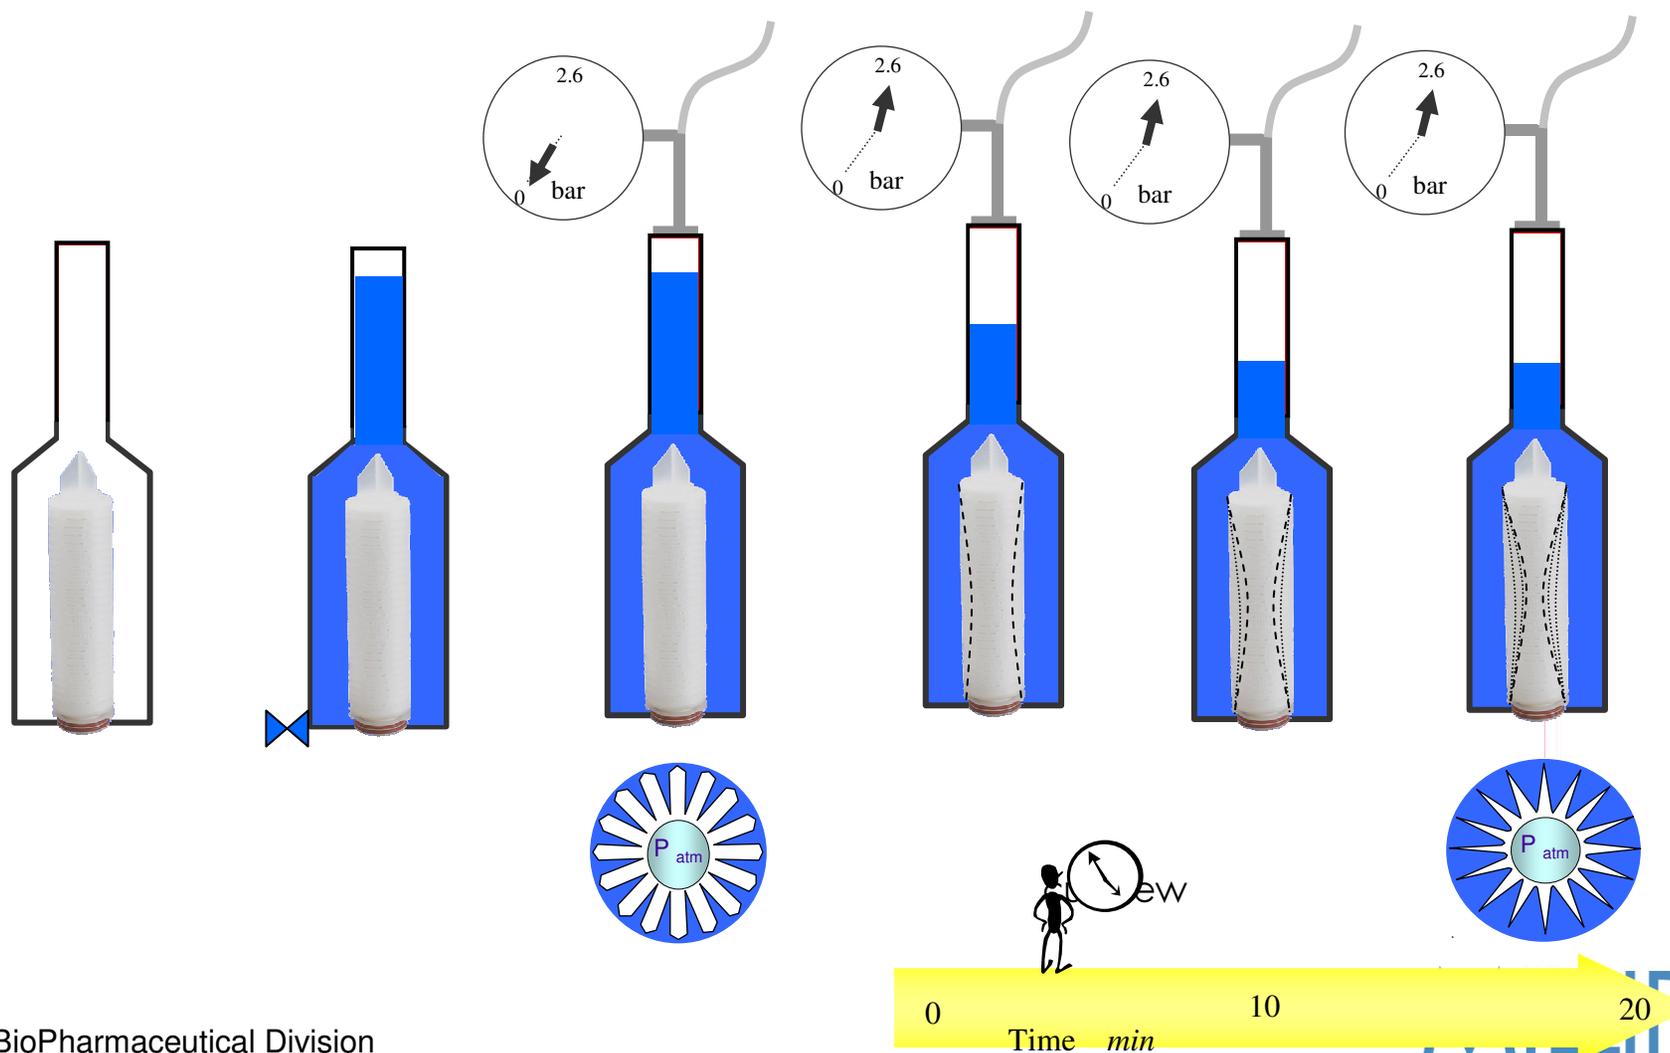

Resistance to water intrusion

- Force water under pressure onto the surface of the filter.
- Applied pressure is $<$ integral filter intrusion pressure
- The water pressure is maintained but not increased.
- Pleated structures compact under pressure
- If integral, the upstream pressure will not drop below a preset value.

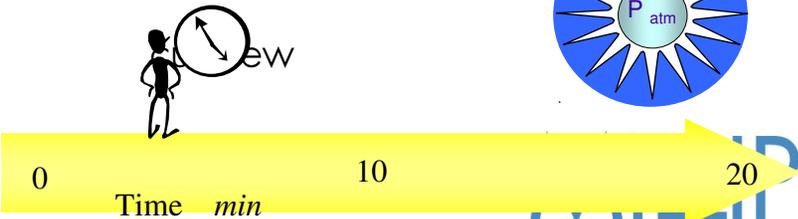

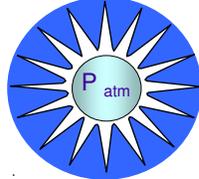

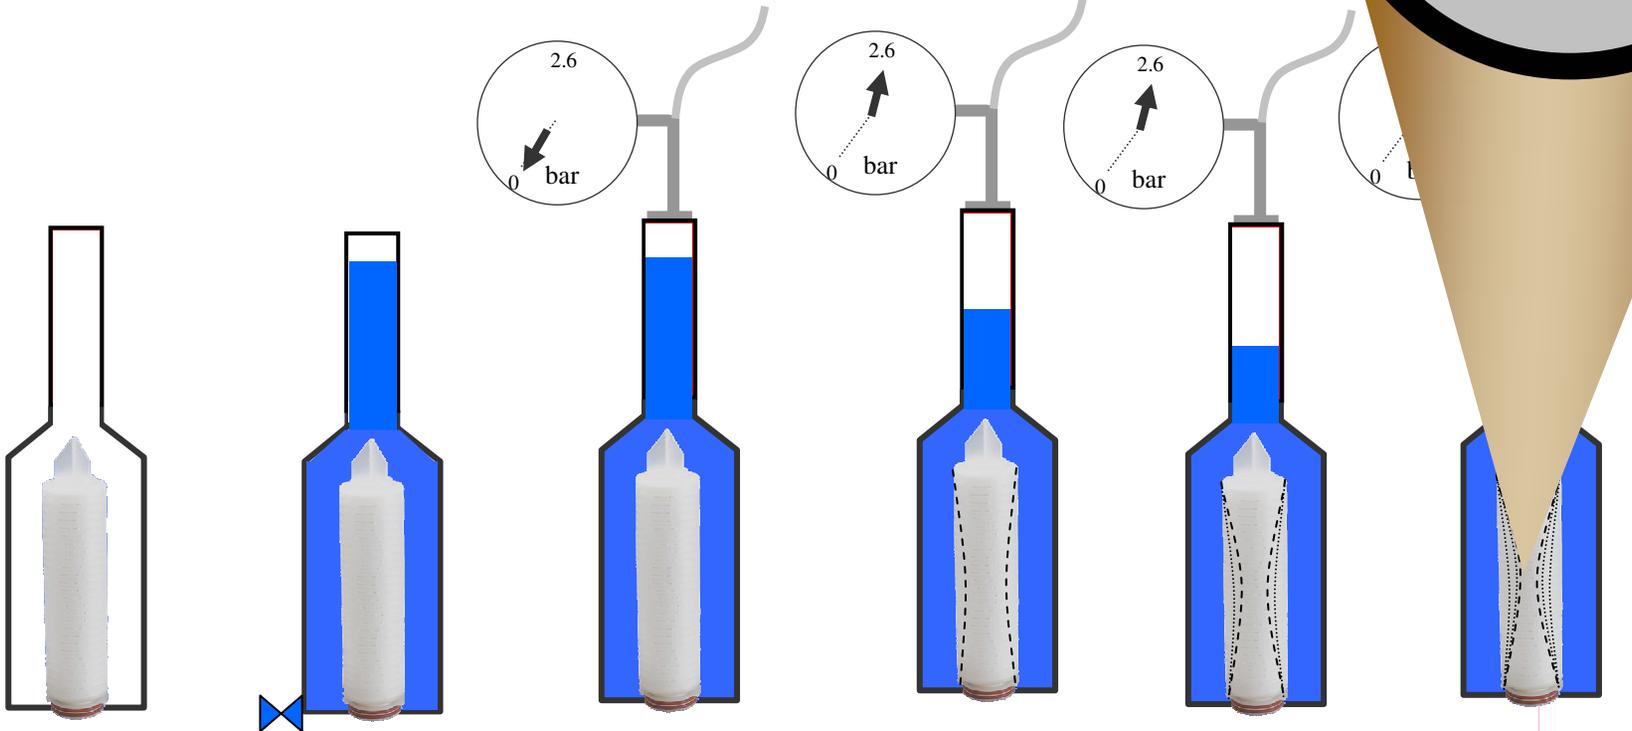

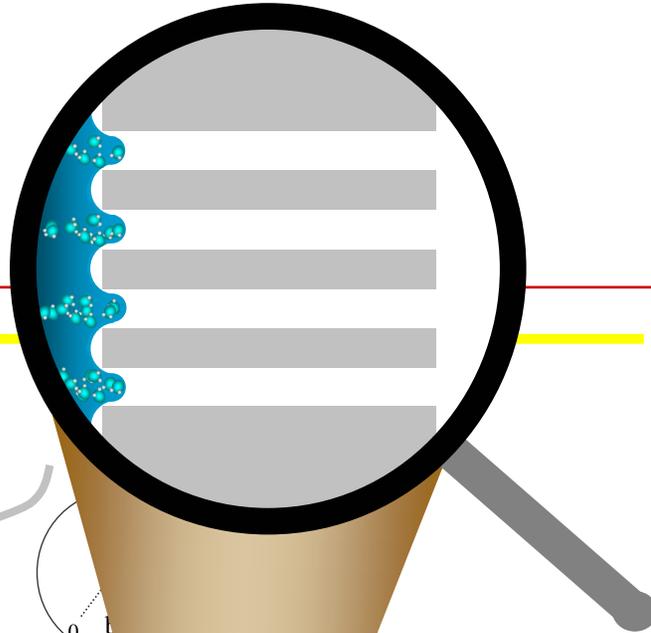

Water test

Resistance to water intrusion

Resistance to water intrusion

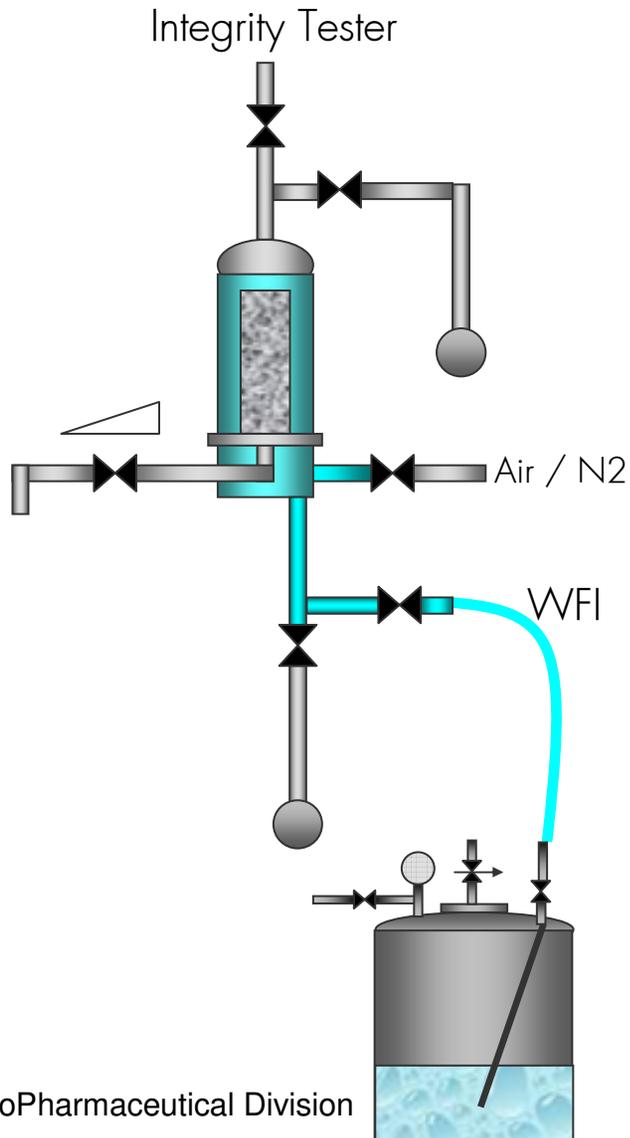

Water test

Resistance to water intrusion

HydroCorr Test

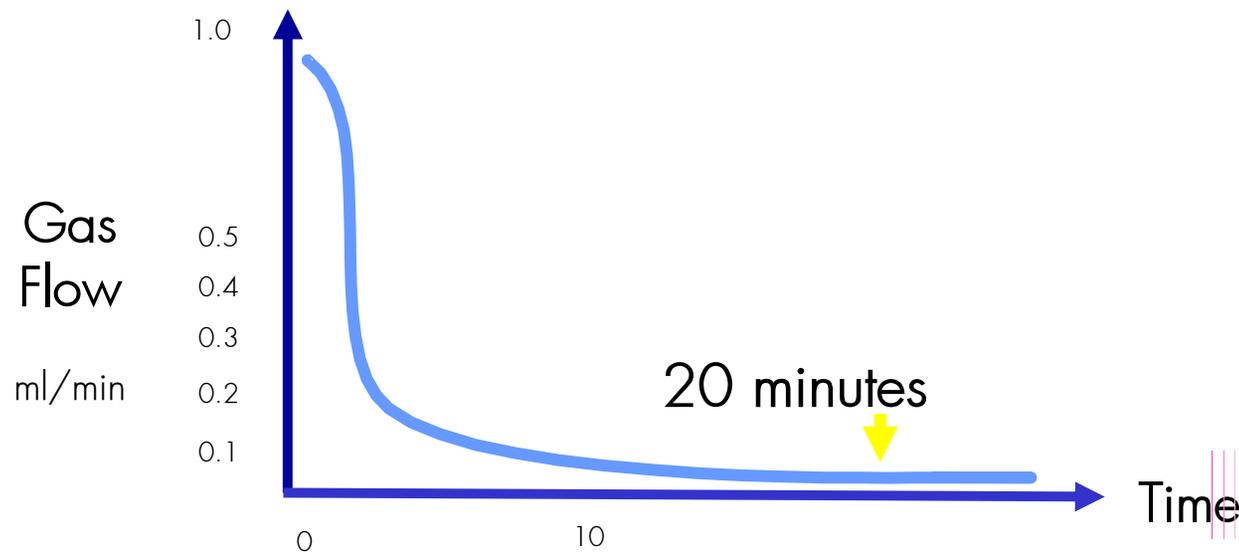

■ HydroCorr test requires

- Filling of the filter with WFI
 - stored in a pressure vessel
 - direct supply line
- Evaluation of the air upstream volume
- Measurement of the pressure drop
- Conversion in HydroCorr rate (ml/min)
 - $\text{Hydrocorr} = (\Delta P \times V) / P_t \times t$

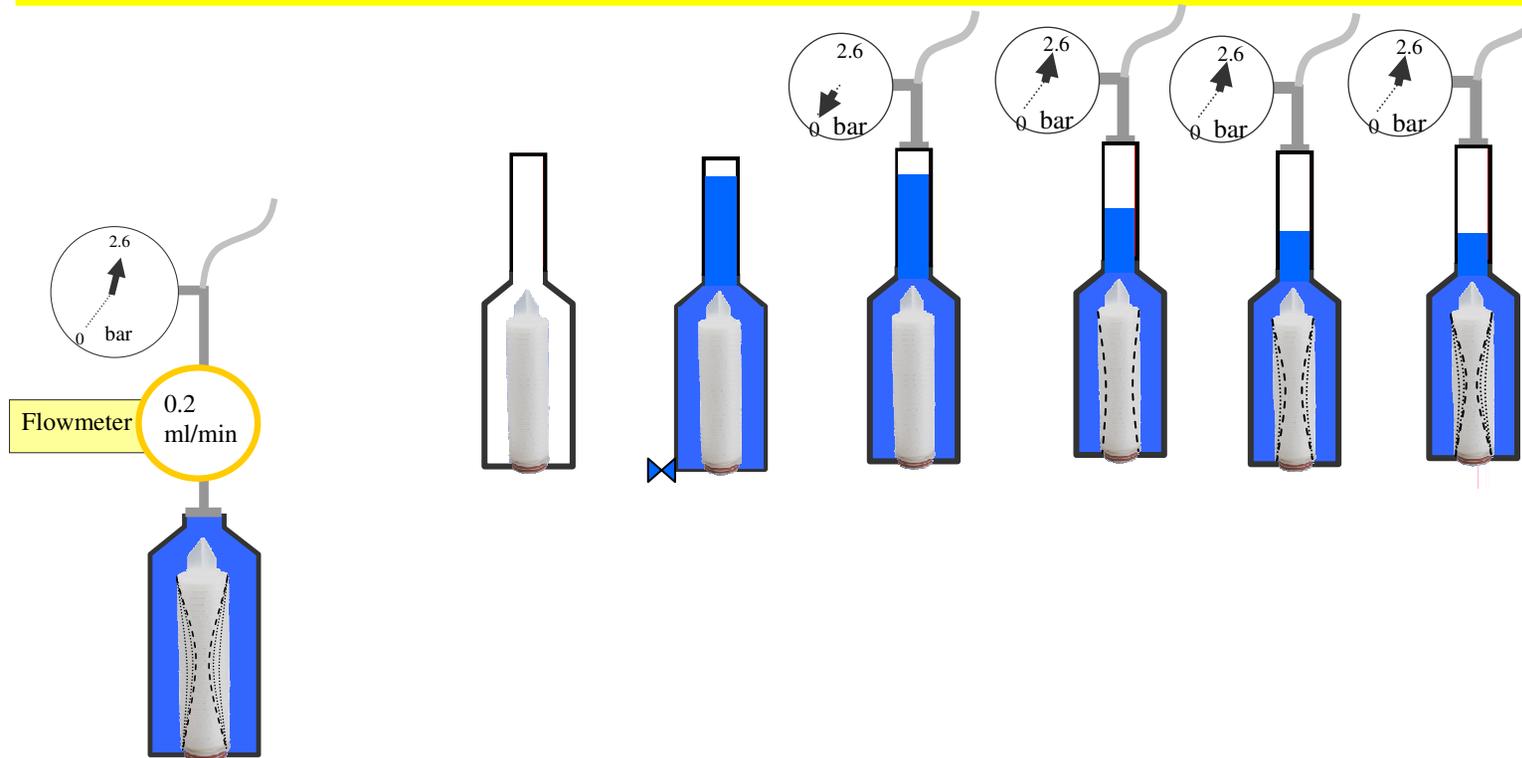

HydroCorr test

- Applicable for all types of hydrophobic testable membranes
- Correlated to bacterial Challenge
- To be conducted on a perfectly dry membrane

Water test

Performing Water-Based Tests

Manually

Use a flow meter to measure actual upstream water displacement

BioPharmaceutical Division

Automatically

Use a pressure transducer to measure upstream gas pressure loss

MILLIPORE
Discover the More in Millipore.™

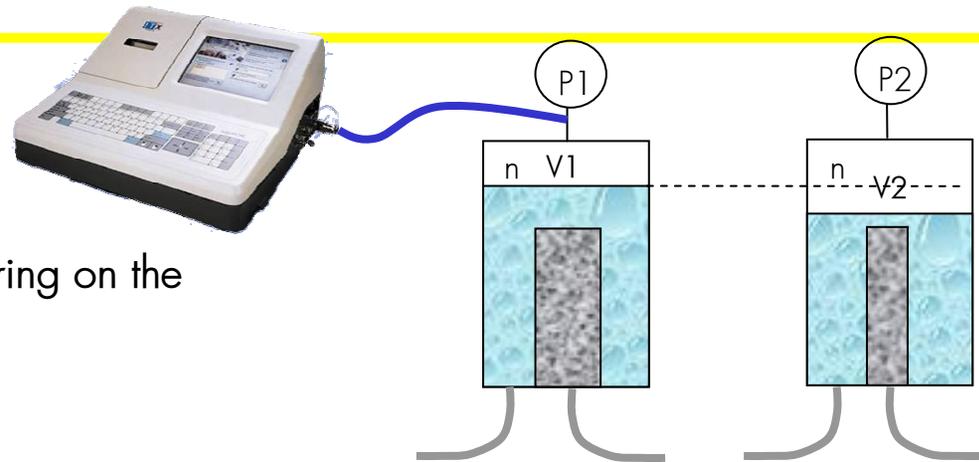

Water test

Automated water based testing

As pleats compress water level drops,

Upstream air volume increases

Principle based on pressure decay monitoring on the upstream side of the filter

Instrument determines volume (V2-V1) change by measuring the corresponding pressure drop (P2-P1)

The gas volume is an isolated system (there is no gas exchange = diffusion is negligible)

The temperature is constant

The ideal gas law written for the system is : $P1 \cdot V1 = P2 \cdot V2 = n R T$

$$\begin{aligned} \text{HydroCorr}_{ml/min} &= (V2-V1) / t \\ &= V1 \cdot (P1 - P2) / P2 \cdot t \\ &= V1 \cdot DP / t \cdot P2 \end{aligned}$$

Absolute !

Water test

Water-Based Test Considerations

- **Must have a leak-free system**
- **Filters must be dry and clean**
- **Temperature changes should be minimized**
- **Reference testing is important**
- **Must have a complete validation package**
- **Values must be comprehensively correlated to microorganism challenge**
